Booth Design Features

1. Web Seat

Web seat offers double the lifetime as traditional spring seats. Standard spring seats lose elasticity over time and results in sagging. Our full sheet web seat evenly distributes weight across the entire frame whilst allowing the foam to retain its firmness longer.

2. Double Stack High Density Foam

We use a 3" contoured seat foam of the highest density (2350) and a 1" finish foam (1845) to create the most comfortable and plush seat on the market.

3. Solid Wood Seat Frame

Solid poplar seat frame are dense and stable and not prone to splitting as pine is.

4. Back Foam

The range from 1.5" to 2" thick

5. Crumb Strip Standard

Catches crumbs and easy cleaning. Standard with most booth designs.

6. Reinforced Corner Joints

All butt joints are prone to failure over time. We use an additional wood L bracket that is face glued to reinforce the joint, making the strongest joint possible. There are over 10 such joints per booth.

Thoughtfully Designed

- Our booths offer more leg support - up to 4" more.
- Ever sat in a booth with a back so straight you are leaning into your food? It's because the back angle is not ergonomically designed. We provide full back and leg support.
- Our doubles are larger to maintain the same back angle, unlike other competitors who make the back more straight to save on materials. The same applies in regards to taller back booths.
